

Let's update week6 Assignment! (20 points)

1- Create a "Student_Info" struct This struct contains all the information needed for each student.

these information are:

- Name
- ID
- Grades array

So Your struct will look something like this: →

```
typedef struct
{
    int ID;
    char Name[100];
    int grades[6];
} Student_info;
```

2- Now create an array of that struct type, the array size is 3 as we have 3 students.

3- Store the same previous information for each of the 3 students in that one array

4- Some of the previous functions will need some updates and some will work the same way, figure it yourself ;)
